

Title: The Green Side to the Oil and Gas Industry

Authors: Saba Sadiq

University of Wyoming

Abstract:

Sustainable and reliable energy on a global scale is foundational to develop a equitable and level-playing ground for EVERYONE to have access to the same and comfortable standard of living. However, I do not believe this can be achieved with either a completely green energy landscape or a exclusively hydrocarbon-based energy systems landscape. Rather, an integrated approach seems more practical and achievable. Where, we should focus on decreasing greenhouse gas emissions first – rather than trying to only eliminate greenhouse gas emissions from the onset. This approach will be illustrated in my poster by highlighting the “green side of the oil and gas industry” in an effort to demystify demonizing propaganda against the oil and gas industry.
